EARTH DRIVE

The Earth Drive is a very versatile pedal. It specializes as a device to help where an amplifier simply can't be pushed to its limits because the situation doesn't allow for such high volume. Often times we find that when an amplifier is run clean, the result can be ice-picky and relatively sterile compared to the truly driven amp sound. In this case, simply dial up the DRIVE knob just enough to help shave off the spikey peaks and add some warmth and body and subtle compression. The Earth Drive can also dial in a very clean sound with no detectable overdrive. This makes it a nice clean-boost as well, and with a subtle mellowing of the overly crispy high treble that can sometimes be an issue with single coil or clean sounding pickups. What makes the Earth Drive so versatile is that it can also dial up a fairly heavy amount of sustaining overdrive for solos or heavy rock rhythm guitar or even just good old boosting and blasting. One thing that's very central to the design of the Earth Drive is that it is not over-voiced or overly EQ'd as we find with most drive pedals. This aspect helps the Earth Drive to retain the natural character of the guitar all the way from clean to dirty.

Controls:

- **VOLUME** - controls output level
- **TONE** - controls treble response
- **DRIVE** - controls amount of overdrive
- **Hard Mechanical Bypass**

Specifications:

- **Input Impedance: 700k Ohms**
- **power requirements: 9VDC**
- **9v alkaline battery recommended**
- **DC power jack - (standard tip negative)**
- **power consumption: pretty low**
